Explain

I have deploy the page through Netlify, you can check the page at https://hardcore-wiles-1979bc.netlify.app

I transformed the HTML file into a react project and added tailwindcss styling library.

In terms of styling, I relocated all content for better understanding and useage of the page.

I have pulled product information from Rainforest API with Axios to fill up the information as well as image.
ps. the API that I used is a pay service which only have 500 request per month, and the Json object does not includ pricing for the product.
